

# The Right Implant For You

## We Are The Experts at Aesthetic Breast Enhancement

With careful consideration and thoughtful planning, a breast augmentation could be one of the best life decisions you'll make. Choosing the best implant type is one of the core considerations during the planning phase. Our office provides a full array of implant types for your consideration. During your consultation we listen to your goals, consider your body type and provide you with expert advice to make a well informed decision.

- ◆ **SALINE** There are main three reasons patients choose saline implants: they are less expensive, they can be introduced through smaller incisions, and some patients – despite all the evidence proving silicone is safe – remain skeptical.
- ◆ **SILCONE** Regular silicone is the softest implant and is often a good choice for women who want the softest feel.
- ◆ **GUMMY BEAR** The 'gummy bear' implant comes in both round and teardrop shapes. They have a firmer gel, which may give a better shape and may last longer. The round gummy bear implant is often a good choice for women with looser tissues and who want a more durable implant that remains soft. The teardrop shaped gummy bear implant may be a good choice for women with particular tissue types, are relatively tight and desire a very proportionate and natural looking enhancement with less fullness of the upper portion of the breast and more projection and fullness of the lower portion of the breast.

**KADZ PLASTIC SURGERY**  
Beauty Redefined in the Hands of Excellence

Bruce B. Kadz M.D., F.A.C.S  
416 North Bedford Drive, Suite 210  
Beverly Hills, CA 90210

Dr. Bruce B. Kadz is board certified by the American Board of Plastic Surgery and is a member of the American Society of Plastic Surgeons

## Other Considerations: Shape, Profile & Placement

There are several other details you may need to consider, like implant sizes and incision sites. One such consideration is the shape of the breast implant. Should you get a round implant, or will a teardrop shaped implant make you look better? Selecting the right implant size is crucial to reaching your goals.

The implant profile, which determines width and projection, is also among the most significant decisions for patients to make with their plastic surgeon. A patient's body frame, desired augmentation size, and other factors can all dictate whether moderate, high, or another profile of implants is the best choice.

*Don't Worry* - We can help review all these choices during your complimentary consultation.
